

Write a Program to create a class named as Product. Product has following attribute

Attribute details	Attribute Name
Unique identification number	id
Product Name	name
Product Price	price
Product Quantity	qty

Define following methods and constructor :

1. constructor to initialise Product id.
2. Method to get product details as Name,Price and Quantity
3. Method to display a product.

class Product:

```
# Constructor to initialize Product ID
```

```
def __init__(self, id):
```

```
    self.id = id
```

```
    self.name = ""
```

```
    self.price = 0
```

```
    self.qty = 0
```

```
# Method to get product details
```

```
def getProductDetails(self):
```

```
    self.name = input("Enter Product Name: ")
```

```
    self.price = float(input("Enter Product Price: "))
```

```
    self.qty = int(input("Enter Product Quantity: "))
```

```
# Method to display product details
```

```
def displayProduct(self):
```

```
    print("\nProduct Details")
```

```
    print("Product ID:", self.id)
```

```
    print("Product Name:", self.name)
```

```
    print("Product Price:", self.price)
```

```
    print("Product Quantity:", self.qty)
```

```
# Creating object
```

```
p1 = Product(101)
```

```
# Getting product details
```

```
p1.getProductDetails()
```

```
# Displaying product details
```

```
p1.displayProduct()
```

Sample Output

```
Enter Product Name: Laptop
```

```
Enter Product Price: 50000
```

```
Enter Product Quantity: 2
```

```
Product Details
```

```
Product ID: 101
```

```
Product Name: Laptop
```

```
Product Price: 50000.0
```

```
Product Quantity: 2
```

This satisfies all requirements:

- Class name: Product
- Attributes: id, name, price, qty
- Constructor to initialize id
- Method to get product details
- Method to display product details
